Baxter Innovations GmbH

Protein folding and aggregation

Aggregation is a generic property of a polypeptide chain

Jahn & Radford, *FEBS Journal*, 2005,75

sub-visible particles

“Undissolved species (other than gas bubbles or droplets) that are unintentionally present in the product. Particles can be foreign (not intrinsic to drug substance) or protein-related (i.e. large aggregates). Particles can be further categorized as visible (>ca. 50 μm) and sub-visible (between ca. 0.1–50 μm); submicron particles (between ca. 0.1–1 μm) are a subcategory of sub-visible particles.”

Methods for size determination of sub-visible particles and aggregates

Tiede et al, Food Additives and Contaminants, 2008, 25

Flow cytometry based sub-visible particle detection and analysis

Baxter

Flow cytometry based sub-visible particle detection and analysis

Baxter

Not detectable 	Non-protein particles; detected 	Protein particles; detected and characterized 
< 100 nm	(0.1 μm) 0.75 μm – ca 70 μm	

- Particles larger than 100 nm can be detected
- Detected particles can be counted
- The size and properties of particles can be determined

 Protein specific dye

 Attribute specific dye

 Protein monomer

 Protein particles

 Non-protein particle

Flow cytometry based sub-visible particle detection and analysis

Baxter

Non-protein particles; detected 	Protein particles; detected and characterized 
(0.1 μm) 0.75 μm – ca 70 μm	

- **Particles larger than 100 nm can be detected**
- **Detected particles can be counted**
- **The size and properties of particles can be determined**

 Protein specific dye

Use of flow cytometry based particle analysis for product development

Baxter

Use of flow cytometry based particle analysis for product development

Use of flow cytometry based particle analysis for product development

Use of flow cytometry based particle analysis for product development

The properties of sub-visible particles may be different for all proteins

Use of flow cytometry based particle analysis for product development

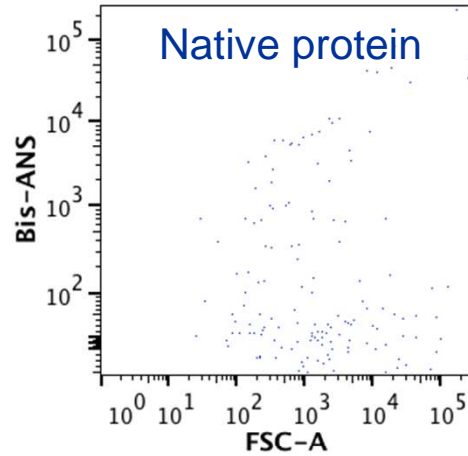

Use of flow cytometry based participle analysis to study protein-silicon interaction

Baxter

Does a native protein bind to silicon?

Use of flow cytometry based participle analysis to study protein-silicon interaction

Does a native protein bind to silicon?

Use of flow cytometry based participle analysis to study protein-silicon interaction

Does a native protein bind to silicon?

Use of flow cytometry based participle analysis to study protein-silicon interaction

Protein binds to silicon sub-visible particles which become stained with BisANS

Take home message

- Sub-visible particles can differ not only in size but also in their structural properties
- Flow cytometry based sub-visible particle analysis is a powerful tool for detection, quantification and characterization of proteinaceous particles
- The method provides orthogonal information to currently available techniques such as Micro-flow imaging and Nanoparticle tracking analysis
